

Name: Mewada Maitrri Manishkumar

Topic: Linux Server Installation, Network Configuration, SSH Access, and User Management

1. Install Ubuntu Server (or CentOS) on VirtualBox or VMware, take a screenshot of your running login screen, and save it as install_success.png.

⇒ Procedure

Install VirtualBox or VMware Workstation.

Download the Ubuntu Server ISO.

Create a new Virtual Machine.

Allocate:

RAM: 2 GB or more

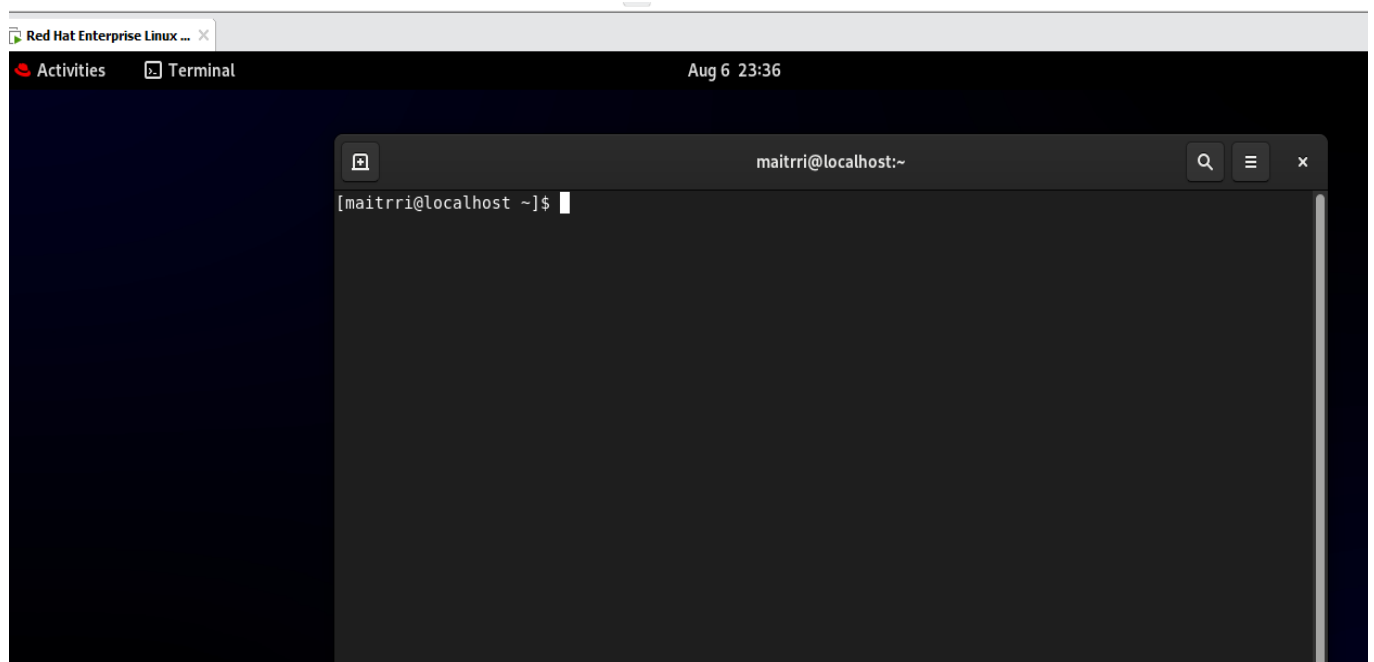

Storage: 20 GB or more

Mount the Ubuntu Server ISO.

Complete the installation.

Restart the virtual machine.

Log in using the username and password created during installation

2. Change the hostname of your Linux VM to 'myfoodiebox' using the hostnamectl command, then verify the change by running the hostname command.

⇒ Step 1: Change the Hostname

```
sudo hostnamectl set-hostname myfoodiebox
```

Step 2: Verify the Hostname

Hostname

3. Configure a static IP address for your VM's network interface (e.g., enp0s3 or eth0) so that it always gets the same IP on reboot.

Hint: Edit /etc/netplan/*.yaml (Ubuntu) or /etc/sysconfig/network-scripts/ifcfg-eth0 (CentOS), then restart networking.

⇒ Ubuntu Server (Netplan)

Open the Netplan configuration file.

```
sudo nano /etc/netplan/00-installer-config.yaml
```

Example configuration:

⇒ network:

```
version: 2
```

```
ethernets:
```

```
  enp0s3:
```

```
    dhcp4: no
```

```
    addresses:
```

```
      - 192.168.1.100/24
```

```
    gateway4: 192.168.1.1
```

```
    nameservers:
```

```
      addresses:
```

```
        - 8.8.8.8
```

```
        - 8.8.4.4
```

Save the file.

Apply the configuration.

```
sudo netplan apply
```

Verify the IP address.

```
ip addr show
```

4. Enable SSH access on your Linux VM and connect to it from your host machine using an SSH client (like PuTTY or ssh command). Show the output of whoami after login.

⇒ Step 1: Install the SSH Server

```
sudo apt update
```

```
sudo apt install openssh-server -y
```

Step 2: Enable SSH

```
sudo systemctl enable ssh
```

```
sudo systemctl start ssh
```

Step 3: Check SSH Status

```
sudo systemctl status ssh
```

Step 4: Connect from the Host Computer

```
ssh username@192.168.1.100
```

Replace:

username with your Linux username

192.168.1.100 with your VM's IP address.

Step 5: Verify Login

```
Whoami
```

5. Create a new user named 'zomatouser' and add them to a new group called 'foodies'. Set their password and verify group membership using the groups command.

⇒ Step 1: Create the Group

```
sudo groupadd foodies
```

Step 2: Create the User

```
sudo useradd -m -G foodies zomatouser
```

Step 3: Set the Password

```
sudo passwd zomatouser
```

⇒ Example:

New password:

Retype new password:

Step 4: Verify Group Membership

groups zomatouser
