Topic: Controlling Access to the file

1. Create a new directory called InstaPhotos in your home folder and add a file named selfie.jpg inside it. Set the permissions so only you (the owner) can read and write the file, but no one else can access it.

⇒ Go to your home directory:

```
cd ~
```

Create the directory:

```
mkdir InstaPhotos
```

Go inside the directory:

```
cd InstaPhotos
```

Create the file:

```
touch selfie.jpg
```

Set permissions:

```
chmod 600 selfie.jpg
```

Verify:

```
ls -l
```

2. Simulate a shared Zomato recipe folder: create a directory called ZomatoRecipes and add a file recipe.txt inside it. Change the permissions so that everyone can read and write the file, but only you can delete it.

Hint: Use the chmod command for permissions and the sticky bit for delete protection.

⇒ Create the directory:

```
mkdir ~/ZomatoRecipes
```

Go inside:

```
cd ~/ZomatoRecipes
```

Create the file:

```
touch recipe.txt
```

Give everyone read and write permission:

```
chmod 666 recipe.txt
```

Enable the sticky bit on the directory:

```
chmod +t ~/ZomatoRecipes
```

Verify:

```
ls -ld ~/ZomatoRecipes
```

```
ls -l
```

3. Change the group ownership of a file named playlist.txt (in your current directory) to a group called musiclovers, so that all group members can collaborate on editing a Spotify-style playlist.

⇒ Change the group ownership:

```
sudo chgrp musiclovers playlist.txt
```

Verify:

```
ls -l playlist.txt
```

4. Use the chmod command to make a script file called paytm_pay.sh executable by everyone, but only editable by you. Then verify the permissions using the ls -l command.

⇒ Set permissions:

```
chmod 755 paytm_pay.sh
```

Verify:

```
ls -l paytm_pay.sh
```

5. A friend sent you a folder called MyntraOffers with files inside, but you can't open any of them. Use the chmod and chown commands to fix the permissions and ownership so that you (and only you) can access and modify all files in the folder.

Hint: Use the -R flag to apply changes recursively.

⇒ Change ownership recursively (replace student with your username if different):

```
sudo chown -R student:student MyntraOffers
```

Set directory permissions recursively:

```
chmod -R 700 MyntraOffers
```

Verify:

```
ls -l MyntraOffers
```
